COMPUTER AND SOFTWARE ENGINEERING DEPARTRMENT
Laboratory Work #7

This laboratory work covers basic HTML code, CSS and JavaScript

Validating Registration Form

Create a html registration form and validate the form using JavaScript code.

Procedure:

Create an html page named as “validateregistration.html”

1. Define a function name as “reset()”, when reset button is clicked all the form elements should be reset as default (it means all the form elements should be empty and focus should be given to the first text box).

2. Define a function name as “check()”, when check button is clicked the validity of all elements should be checked such as:

a) checking for blank entry, name, age, radio button, checkbox, if any of the elements is empty or has a non-valid value then you should take an alert e.g.

`alert("please enter the password")`

`alert("please enter the address")`

`alert("please select the languages known")`

`alert("please enter the age correctly")`

`alert("please enter the correct name")`

b) Once all the valuables are properly filled make the following confirmation.

`confirm("you have entered the data correctly, Thank you")`

Note: for Age text box you should consider a limitation, if the age is greater than 40 you should take into the consideration the following alert too:

```
alert("Sorry you age is beyound the limit")
```

Enter your Name :

Enter your Age :
Enter your Address :
Sex :

☐ Female
☐ Male

Languages Known :

(select more than one)

☐ C
☐ C++
☐ VB
☐ JAVA
☐ ASP
☐ OTHERS

Enter your Password :
